2.2 Assumptions 4

2.3 Start the conversion routine 4

Before you run the new version of Pedago lön

1 Introduction

1.1 Background

The new 64-bit version of Pedago lön is compatible with the 2.x database schema but the system/bootstrap database has been moved into the same database server as your production databases. This means that from now on this list is global for all users. It also simplifies installation of subsequent clients.

This system/bootstrap database holds your license key and the list pf companies you see at login when you pressF4.

This info needs to be copied and this is the purpose of the conversion.

1.2 How do I obtain the conversion program?

The standalone converter can be downloaded from www.pedago.fi/pa

1.3 Do I have to run the conversion on all clients?

No. Just run it once and it will create a database called Pedago_lpsys.

On subsequent clients, Pedago lön will use this database if there is a lpsys.dsn that points to it. If not, then Pedago lön will ask for the location of your database server and create a lpsys.dsn for you. This assumes that Pedago lön is run as administrator when doing so.

1.4 Coexistence of 2.x and 3.x

The two versions 2.x (32-bit) and 3.x (64-bit) can be run concurrently, but we suggest that you use the new version going forward. We have been running this new version internally since spring 2025 and started rollout of Pedago lön 3.x to customers in May 2026.

The installation of the new version and/or the conversion does not change or remove your existing installation of Pedago lön 2.x. Only the icon that starts Pedago lön is changed to point to the new version The old version remains and can be uninstalled when you have verified that the new installation works for you.

2 Run the conversion program

2.1 Rights needed

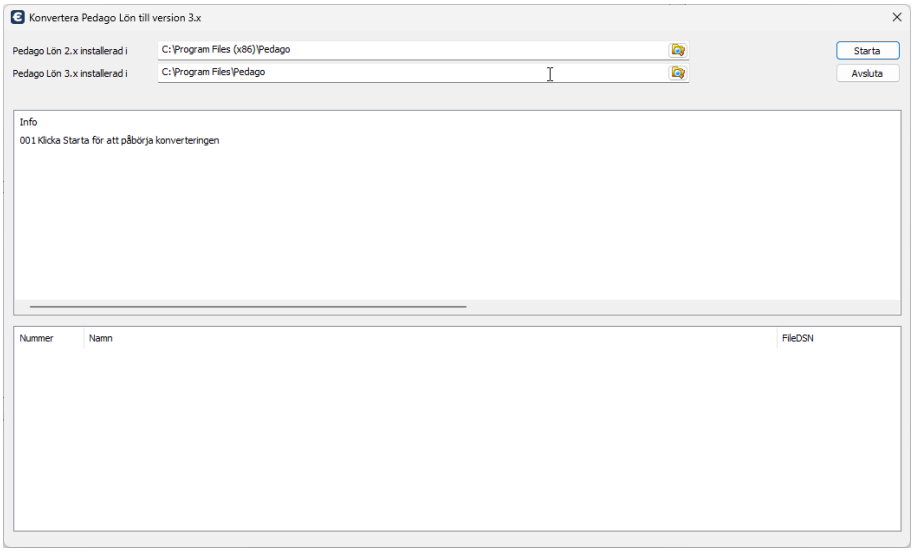

You need to have administrator rights to the workstation you also need database create rights to the database server to run the conversion.

2.2 Assumptions

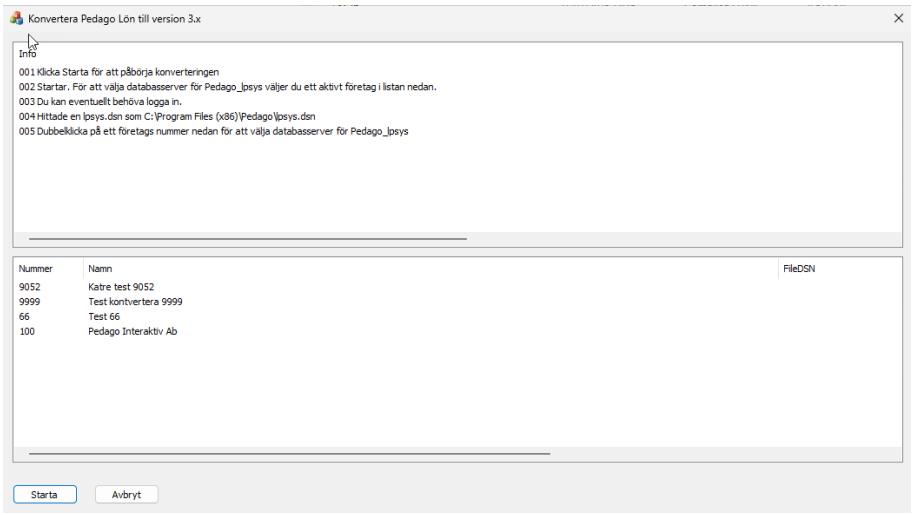

The conversion program assumes that the new version is installed in C:\Program Files\Pedago and will create a new lpsys.dsn there. You can however change this when running the program

2.3 Start the conversion routine

Start by running LP3Konv.exe**, as an administrator**:

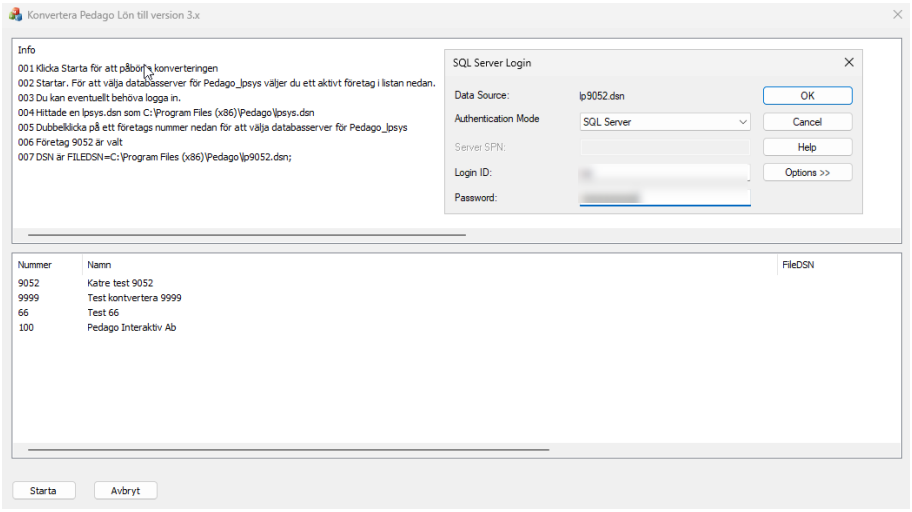

Select folders for old and new versions, then click “Starta”

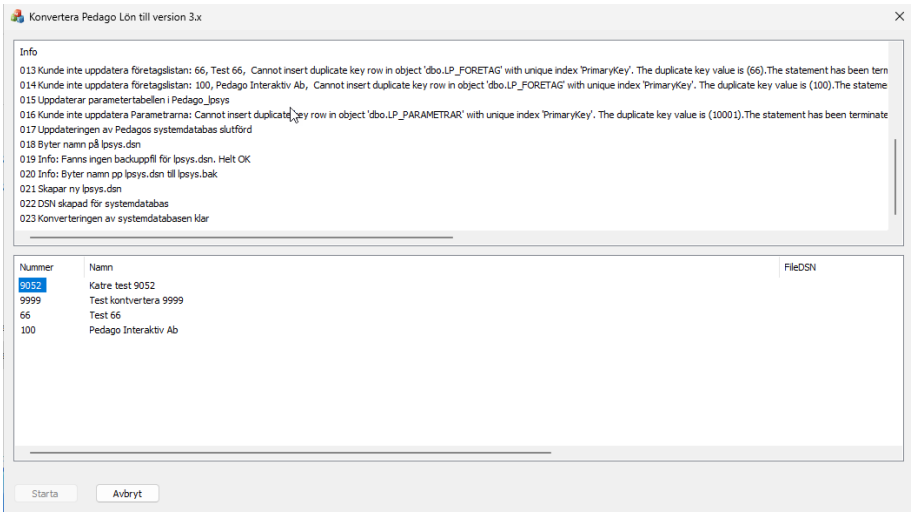

The conversion program has found a valid lpsys.mdb and asks you to select one company to determine where your database server is.located.

Double-click on the number in the column named ”Nummer” and the program will connect to that server. You may need to log in.

Parameters and list of companies are copied to Pedago_lpsys.

In the example, there was already a database Pedago_lpsys. In this case the program just updates the list of companies. If a company is present, you will get a message saying there are duplicates. This message can be ignored.

As a last step, all dsn-files lpxxxx.dsn are copied to the new program folder.

To end the routine, click ”Avsluta”. You are now ready to use the new version of Pedago lön.
